Hidden Leaf Networks LLC — Detroit, Michigan — hiddenleafnetworks.com

SOURCES SOUGHT RESPONSE

Date: November 09, 2026 **Reference:** 6973GH-27-R-FOMSSOFTWAREDEVELOPMENT **Subject:** FOMS Software Development **NAICS Code:** 541511

To: Erick Martinez **Email:** erick.i.martinez-abril@faa.gov

From: Carl E. Jones III, Founder & Principal Hidden Leaf Networks, LLC Detroit, Michigan carl@hiddenleafnetworks.com https://www.hiddenleafnetworks.com

1. Company Identification

Field	Value
Legal Name	HIDDEN LEAF NETWORKS, LLC
CAGE Code	26PF4
UEI	X6B2SPZ64KP3
SAM.gov Status	Active
Business Size	Small Business
Business Type	Single-Member LLC
Primary NAICS	541512 — Computer Systems Design Services
Additional NAICS	541519, 541511
Location	Detroit, Michigan
Year Established	2025

2. Capability Overview

Hidden Leaf Networks, LLC (HLN) is a Detroit-based small technology firm specializing in custom software development for operations management systems, workflow-driven applications, and AI-augmented process tooling. HLN builds production-grade systems where data integrity, operational accountability, and user workflow efficiency are non-negotiable requirements — a profile that aligns directly with the FAA's Flight Operations Management System (FOMS) software development needs.

Facilities Operations Management Systems — whether supporting flight operations, maintenance tracking, or logistics — require the same core engineering disciplines that HLN applies across its platform portfolio: reliable state management, complex business rule implementation, structured data persistence, and interfaces designed for high-stakes operational users.

Core Capabilities Relevant to This Requirement:

- Custom software development for operations management and scheduling systems — multi-step workflows, state machine logic, constraint-based scheduling
- Full-stack application development: Python (FastAPI), TypeScript, React/Next.js, Node.js — modern, maintainable, testable codebases
- Database design and optimization: PostgreSQL, Redis — schema design for operational data with audit history, versioning, and reporting requirements
- API development and legacy system integration — REST and GraphQL APIs bridging new application layers to existing data stores
- Automated testing infrastructure — unit, integration, and end-to-end test suites (500+ tests across active HLN platforms), critical for safety-adjacent operational software
- AI-assisted workflow automation — intelligent scheduling suggestions, anomaly detection, and predictive alerting applicable to flight operations contexts
- Operational dashboard development — real-time data visualization, status monitoring, and configurable alerting for operations center environments
- Section 508 accessibility compliance and responsive design for operational users across device types

HLN's **Scroll** platform (a multi-engine AI orchestration runtime) and **HLN Relay** (a multi-stakeholder workflow management system) both demonstrate HLN's capacity to build complex, stateful operational software with rigorous quality standards. The Scroll platform alone has accumulated 500+ automated tests and supports concurrent multi-engine orchestration — an engineering discipline directly applicable to FOMS's reliability requirements.

3. Relevant Experience

HLN is a newly established LLC without federal contract past performance. The principal engineer's background directly applies to operations management software development:

Carl E. Jones III — Founder & Principal Engineer

- 12+ years in software quality assurance, systems engineering, and application development

- Industrial systems engineering experience at Ford Motor Company and Hi-Lex Controls — operations management software in manufacturing environments where system reliability and data accuracy are safety-critical
- Full-stack development: Python, TypeScript, React, FastAPI, Docker, PostgreSQL, Redis — with emphasis on correctness, testability, and long-term maintainability
- State machine and workflow engine implementation — HLN's operational platforms use Temporal-compatible workflow orchestration patterns for durable, recoverable process management
- Multi-tenant application design with role-based access controls, audit logging, and change history — standard requirements for operational management systems
- Experience building scheduling and resource management tooling for multi-stakeholder environments
- Mechatronics background (Henry Ford College ASSET program) — foundational understanding of operations management contexts, maintenance workflows, and industrial process data

4. Teaming Arrangements

HLN is open to this opportunity as either a prime or subcontractor. Given the FAA's safety-critical environment and potential existing system familiarity requirements, HLN is particularly interested in teaming with firms that have existing FAA program experience or ATO familiarity — contributing HLN's application development, test automation, and AI integration capabilities as a subcontractor.

HLN is a small business under NAICS 541511 and 541512. If FOMS is structured for small business competition, HLN would pursue prime consideration and build a team with complementary ATO and program management capabilities.

5. Questions for the Contracting Officer

1. Can the FAA provide a high-level description of FOMS's current technology stack (languages, frameworks, database, hosting environment) and whether this effort is greenfield development, legacy modernization, or ongoing feature development and sustainment?

2. What is the anticipated place of performance — Oklahoma City on-site, remote, or hybrid? Are there FedRAMP or DoT-specific cloud hosting requirements?

3. Is this requirement anticipated to be a small business set-aside, and under which NAICS code (541511 or an alternative)?

4. Will the FOMS development effort require familiarity with FAA-specific safety standards, DO-178C, or other avionics software development guidelines, or is the system outside the safety-critical certification boundary?

5. What is the anticipated period of performance and approximate contract value range? Is this a new standalone contract or a recompete of an existing vehicle?

6. Interest Level and Set-Aside Recommendation

Hidden Leaf Networks, LLC expresses **strong interest** in the FOMS Software Development requirement. Operations management software development — combining rigorous business logic, reliable state management, and high-stakes user workflows — is a core HLN competency. HLN's industrial engineering background and test-driven development culture are particular differentiators for FAA's operational context.

HLN recommends the FAA evaluate a **Small Business Set-Aside** under NAICS 541511, given the strong availability of technically qualified small firms in this space.

HLN is prepared to provide a technical capability briefing, code portfolio demonstration, or teaming discussion at the FAA's convenience.

Respectfully submitted,

Carl E. Jones III
